- No Real Smoke!**
- No Tobacco!**
- No Ashtrays!**
- No Cigarette Butts!**
- No Smell & Air Pollution!**
- No Harmful Second-hand Smoke!**

47 Million Potential Customers!

What is a SmokeStik?

A SmokeStik is a revolutionary device that resembles a traditional cigarette and fully recreates the smoking experience, including "smoke," without any harmful side effects. It is a clean alternative to traditional cigarette smoking. It is free of carbon monoxide, tar, and the cancer-causing chemicals found in traditional cigarettes and cigars. An electronic cigarette is essentially litter-less in that it is free of ashes and stubs. Also, it is much safer since it is free of fire. What you are "smoking" is a mist or vapor. This vapor is created as propylene glycol is vaporized by a tiny component called the atomizer. SmokeStiks are the ONLY e-cigarette packaged and assembled in the USA!

How Does it Work?

The mouthpiece contains a replaceable cartridge filled with liquid. The main substances contained in the liquid are propylene glycol, and optional flavors. When you take a drag on the SmokeStik, the air flow is detected by a tiny sensor. A microprocessor then activates the atomizer which injects tiny droplets of the liquid into the flowing air and vaporizes the liquid. This produces a vapor mist which you inhale - just like smoke from a traditional cigarette. It tastes and feels just like a regular cigarette, and you exhale "smoke," just like you would with a traditional cigarette. An orange LED at the tip of the device is also activated to simulate the burning end of a lit cigarette.

A high-density Lithium Ion battery powers the device and will last all day on a normal charge. Your starter kit will include two batteries so that you may use one while your second battery is recharging.
